

11. (Previously presented) A method for docking a camera, the method comprising the steps of:

coupling the camera to a docking station platform; and  
rotating the camera relative to the base and about an axis of rotation, the rotation permitted by the docking station platform configured to couple to a docking station base such that the docking station platform may be rotated about the axis of rotation.

12. (Original) The method of claim 11, further comprising the step of communicating information from the camera to a processing system.

13. (Original) The method of claim 12, wherein the step of communicating further comprises the step of communication with a communication medium used by a communication device.

14. (Original) The method of claim 13, wherein the communication medium comprises at least one selected from a group consisting of a wire connection medium, an infrared medium, a cable medium, a microwave medium, a radio frequency (RF) medium, an intermediary communication system may be employed, a telephony system medium and an Internet medium.

15. (Previously presented) A system for docking a camera, comprising:
  - means for physically coupling the camera to a docking station platform;
  - means for communicatively coupling the camera to a docking station platform;

and

  - means for rotating the camera relative to a docking station base and about an axis of rotation, the rotation permitted by the docking station platform configured to couple to the docking station base such that the docking station platform may be rotated about the axis of rotation.
16. (Original) The system of claim 15, further comprising means for rigidly coupling the camera to the docking station platform.
17. (Original) The system of claim 15, further comprising means for communicating information from the camera to a processing system.
18. (Original) The system of claim 17, wherein the means for communicating further comprises means for communicating with a communication medium used by a communication device.
19. (Original) The system of claim 18, wherein the communication medium comprises at least one selected from a group consisting of a wire connection medium, an infrared medium, a cable medium, a microwave medium, a radio frequency (RF) medium, an intermediary communication system may be employed, a telephony system medium and an Internet medium.
